Hi!

Thanks for applying for the Full Stack Developer Intern role at Enrichly HR, Inc. We've reviewed your application and would like to move you to the next stage.

The next step is a take-home assignment. It's attached as a PDF.

The short version: build a small web application where users can create and manage automated jobs - create them, run them, see execution history, and understand what happened when something fails. We've deliberately left much of the product undefined. We're more interested in the decisions you make and your reasoning than in whether you match a spec.

A few things worth knowing before you start:

Time: aim for 8–12 hours. A smaller product built properly beats a larger one that's half-finished.

Stack: we prefer Next.js + React + TypeScript + .NET/C# + PostgreSQL, but you can use something else if you have a good reason.

AI tools: use them freely. We only ask that you can explain what you built and why.

Deadline: please submit by September 14th 2026

To submit, reply to this email with:

- A live URL where we can use the application
- A link to your GitHub repository
- An ENGINEERING.md in the repo covering your architecture, key decisions, and known limitations
- If anything in the assignment is unclear, or if you need more time, just reply here.

Looking forward to seeing what you build.

Best regards,
Meenu Yadav
